LPUCART VIDEO RECORDING GUIDE

Target length: 4 minutes 55 seconds | Keep your camera visible in a small corner throughout.

Keep these 3 files open in VS Code	**HTML** order.html	**CSS** css/style.css	**JavaScript** js/pricing.js
Website demo: open the live order page; show the home page first if time allows.	HTML structure for the order page	Shared page design and layout	Price rules and total calculation

TIME	SHOW / DO	SAY THIS
0:00-0:25	**Slide 1: Title slide. Say all 3 names.**	“Hello, my name is [your name]. My teammates are [name two] and [name three]. Together, we developed LPUCart. I will show the website, explain one HTML file, one CSS file and one JavaScript file, then walk through the student order flow.”
0:25-0:50	**Slide 2: Project purpose and a website screenshot.**	“LPUCart is a campus parcel delivery website. It is designed to help students request delivery from Uni Mall to a hostel gate, a room or a live location. Let us look at the website.”
0:50-1:25	**Slide 3: Browser. Show home briefly, then the order page.**	“The home page introduces the service and its delivery options. This order page is where the student enters parcel and delivery details. Now I will explain how this page is built.”
1:25-2:00	**Slide 4: VS Code - open order.html. Point to headings, form fields and links.**	“This is order.html. HTML provides the structure of the page, including its headings, form fields, buttons and sections. The page also connects to the shared CSS and JavaScript files.”
2:00-2:30	**Slide 5: VS Code - open css/style.css. Show a relevant style rule.**	“This is style.css. CSS controls the page appearance, including colours, spacing, layout and responsive styling. It helps keep the website’s pages visually consistent.”
2:30-3:35	**Slide 6: VS Code - open js/pricing.js. Show PRICES and calculateOrderPrice.**	“This is pricing.js. It stores the delivery price rules and calculates the order total based on the selected delivery type and parcel count. The order page uses JavaScript so the displayed price can respond to the student’s choices. Other project files handle shared interactions and demo data.”
3:35-4:40	**Slide 7, then browser. Demonstrate the order steps and tracking/history if available.**	“Here is the complete student flow. The student opens the order page, enters the requested details and chooses a delivery option. The page calculates and displays the price. The student submits the request, and the demo creates an order record with an OTP for handover. The tracking and history pages show order information available in the demo. This project stores demo data in the browser.”
4:40-4:55	**Return to the final slide. Smile, pause, finish.**	“To recap, HTML builds the page structure, CSS styles it, and JavaScript handles pricing and interactions. Thank you for watching our LPUCart presentation.”

Before recording: Replace the name placeholders. Record your screen and voice, then place your webcam in a corner. Keep code readable and only describe features you can show working. Your one code file per language: **order.html**, **css/style.css**, **js/pricing.js**.
